Ready for your next PayIn question.

Use the prompt bar below. Scope, data coverage, and tips live on the **About Agent** page.

can I find the refund % (by transaction count) in BR MOR transactions beyond [redacted]days of payment? will be great if we can segment this by Adyen vs dLocal, BEX vs HCOM . Data from past year and past [redacted]months will be super helpful.

Great, the query succeeded! Here's a comprehensive breakdown of the results:

🇧🇷 Brazil MOR — Refund Rate Beyond [redacted] Days of Payment

Scope: Brazil PoSa | Adyen & dLocal | BEX (Expedia) & HCOM[redacted]| Card transactions only

Metric definitions:

- **Overall Refund %** = All refunded transactions / Total transactions
- [redacted]**Refund % (of Total)** = Transactions refunded after [redacted]days / Total transactions
- [redacted]**Refund % (of Refunded)** = Transactions refunded after [redacted]days / All refunded transactions ← *the most meaningful signal for late-refund behavior*

📅 Past [redacted]Months (Feb–May [redacted])

Processor	Brand	Total Txns	Refunded Txns	Overall Refund %	[redacted] Refunds	[redacted] % of Total	[redacted]% of Refunded
Adyen	BEX (Expedia)	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]
Adyen	HCOM [redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]
dLocal	BEX (Expedia)	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]
dLocal	HCOM [redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]

⚠️ **Zero [redacted]refunds in the past [redacted]months** — this is expected! Transactions from the past [redacted]months are at most [redacted]days old, so by definition, none can yet have a refund recorded beyond [redacted]days of the payment date. This window is too short to capture late refunds.

Agent UI

📅 Past [redacted] Months (May [redacted])

Processor	Brand	Total Txns	Refunded Txns	Overall Refund %	[redacted] Refunds	[redacted] % of Total	[redacted]% of Refunded
Adyen	BEX (Expedia)	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]
Adyen	HCOM [redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]
dLocal	BEX (Expedia)	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]
dLocal	HCOM [redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]

📖 Key Takeaways

[redacted] **Adyen has significantly more late refunds than dLocal:**

- On Adyen, [redacted] **of all refunds** happen beyond [redacted] days of payment [redacted] for BEX, [redacted] for HCOM)
- On dLocal, this is much lower at [redacted]
- This could reflect differences in how each processor handles refund windows, or differences in the booking types routed through each processor

[redacted] **HCOM shows slightly higher late-refund rates than BEX on Adyen:**

- HCOM/Adyen: [redacted] of refunds are [redacted] vs BEX/Adyen: [redacted]
- This may relate to HCOM's booking mix (e.g., longer-stay hotel bookings with later cancellation windows)

[redacted] **Volume context:** Adyen dominates Brazil MOR volume — HCOM/Adyen alone accounts for [redacted] transactions vs [redacted] for dLocal/HCOM. The absolute count of late refunds on Adyen [redacted] for HCOM) is much larger than dLocal [redacted] for HCOM).

[redacted] [redacted] **window is not useful for this analysis** — as noted above, transactions from the past [redacted] months haven't had enough time to generate [redacted] refunds. The [redacted] view is the right lens here.

Would you like me to drill deeper — for example, by card brand, by month trend, or by looking at the distribution of refund timing (e.g., [redacted])
